

## **PPG – Delaware**

The PPG Delaware facility is continuously repairing and replacing concrete around the facility due to normal wear and tear. Previously, construction debris had been sent to a landfill 40 miles away. The nearby limestone quarry was in search of clean hard fill for areas of their property that were no longer mined. The quarry is less than 5 miles from the facility. The facility environmental department completed an audit of the quarry to determine if it could be an approved disposal/recycling location and was approved by PPG corporate. The facility was able to recycle 1470 tons of construction debris and save \$116,000 in disposal/transportation cost in 2022. Due to this approval future planned construction projects will benefit from the new recycling option. The site won an internal environmental impact award for PPG. The application will explain further the sustainability impact of reduction in waste, energy and other savings.
